Watch out for Bombs, Leo!

By Rogelio Kenny Arisandi

In the heart of the serene GPT Whisperer Forest, Leo, the wise and vigilant guardian, was enjoying a peaceful evening when he received a distressing call from his friend BonBon. BonBon, a brilliant mathematician, revealed that rival forces had planted three bombs at specific locations within the forest. The bombs were marked with coordinates: the first at **(X1, Y1)** with a radius of **R1**, the second at **(X2, Y2)** with a radius of **R2**, and the third at **(X3, Y3)** with a radius of **R3**. Leo's location was at **(leoX, leoY)**. BonBon's calculations were crucial to determine how many of these bombs could potentially hit Leo based on his current position.

As BonBon quickly calculated the distances between Leo's location and the bomb sites, the calm of the forest turned to worry. Leo waited anxiously for the results to see if he was at risk from one, two, or all three bombs. The forest held its breath, depending on BonBon's analysis to guide Leo and ensure his safety.

CONSTRAINT:

- **0 < X1, Y1, R1** < 100000
- **0 < X2, Y2, R2** < 100000
- **0 < X3, Y3, R3**< 100000
- **0 < leoX, leoY**< 100000

INPUTS:

The 3 bombs marked with **(X1, Y1)** and **R1, (X2, Y2)** and **R2, (X3, Y3)** and **R3** Coordinate and Leo's X and Y coordinate marked by **(leoX, leoY)**

OUTPUTS:

- if Leo got hit by 3 bombs Output: `LEO, YOU GOT 3 BOMBS ON YOUR TAIL, RUN MUCH FASTER`
- 2 Bombs then `Lil bro run a bit quicker there are 2 bombs`
- 1 Bomb then we output: `Meh only one bomb`
- None then you can output: `We chill`

SAMPLE INPUT/OUTPUT:

Example 1:

INPUT:

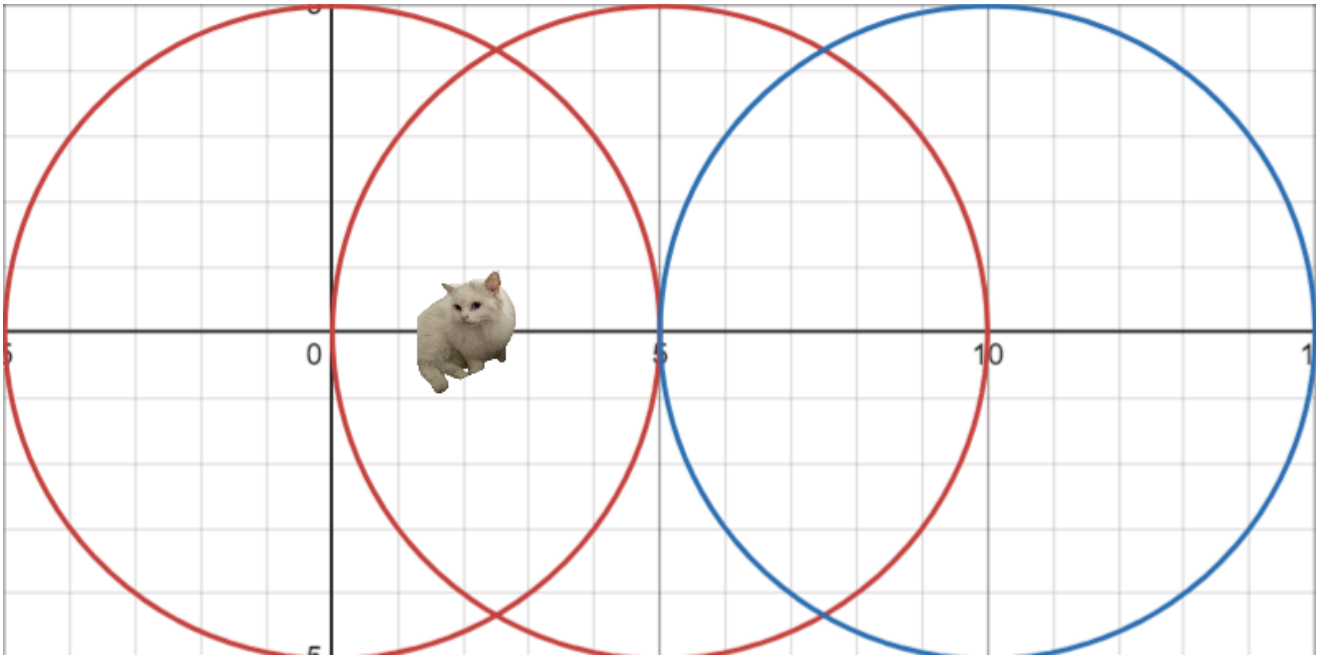
`0 0 5`
`5 0 5`
`10 0 5`
`2 0`

OUTPUT:
`Lil bro run a bit quicker there are 2 bombs`

Example 2:

INPUT:

`0 0 5`
`5 0 5`
`10 0 5`
`50 50`

OUTPUT:
`We chill`


Sample 1 Explanation:
