HTTP Server Basic

Description: Write a Python program using the socket module that creates a basic HTTP server returning a Hello World HTML page.

Your task is to implement the following functions:

1. create_server() -> socket.socket: This function creates a TCP socket, sets SO_REUSEADDR, binds to ('localhost', 8080), listens with backlog 5, and returns the socket.

2. generate_response() -> bytes: This function returns a complete HTTP 200 response with Content-Type: text/html and a body of '<html><body><h1>Hello, World!</h1></body></html>'.

3. serve() -> None: This function runs the server using select, accepts connections, sends the response from generate_response(), and handles KeyboardInterrupt to close the server.

Input: None.

Output (without unit test): The server runs and handles connections.

Output (with unit test):

```
Testing create_server ...
bind called with: call(('localhost', 8080))
listen called with: call(5)
Testing generate_response ...
test attribute passed: b'Hello, World!' is in b'HTTP/1.1 200 OK\r\nContent-Type: text/html\r\nContent-Length: 48\r\n\r\n<html><body><h1>Hello, World!</h1></body></html>'
Testing serve ...
accept called with: call()
test attribute passed: call(('localhost', 8080)) is equal to call(('localhost', 8080))
test attribute listen passed: True is True
test attribute accept passed: True is True
test attribute close passed: True is True
```
