

HTTP Check Redirect

Description: Write a Python program using the socket module that determines whether an HTTP response indicates a redirect.

Your task is to implement the following functions:

1. `is_redirect(response: str) -> bool`: This function checks whether the HTTP status code in the response is in the 3xx range (300-399). Return True if redirect, False otherwise.
2. `make_redirect_request() -> bool`: This function creates a socket, connects to 'httpbin.org' on port 80, sends a GET request to '/redirect/1', receives the response, and returns whether it is a redirect.

Input: None.

Output (without unit test): True if the response is a redirect, False otherwise.

Output (with unit test):

```
Testing is_redirect ...
test attribute passed: True is equal to True
test attribute passed: False is equal to False
test attribute passed: False is equal to False
Testing make_redirect_request ...
connect called with: call(('httpbin.org', 80))
send called with: call(b'GET /redirect/1 HTTP/1.1\r\nHost: httpbin.org\r\nConnection: close\r\n\r\n')
recv called with: call(4096)
test attribute passed: True is equal to True
```
