

HTTP GET Status Code

Description: Write a Python program using the socket module that extracts the HTTP status code from a raw HTTP response string, and makes a GET request to `httpbin.org` to retrieve a status code response.

Your task is to implement the following functions:

1. `get_status_code(response: str) -> int`: This function takes a raw HTTP response string and returns the integer HTTP status code. For example, given `"HTTP/1.1 200 OK\r\n..."`, it returns `200`.
2. `make_request() -> int`: This function creates a socket, connects to `'httpbin.org'` on port `80`, sends a GET request to `'/status/200'`, receives the response, and returns the status code using `get_status_code`.

Input: None.

Output (without unit test): The HTTP status code (e.g. `200`).

Output (with unit test):

```
Testing get_status_code ...
test attribute passed: 200 is equal to 200
test attribute passed: 404 is equal to 404
Testing make_request ...
connect called with: call(('httpbin.org', 80))
send called with: call(b'GET /status/200 HTTP/1.1\r\nHost: httpbin.org\r\nConnection: close\r\n\r\n')
recv called with: call(4096)
test attribute passed: 200 is equal to 200
```
