

HTTP Parse Content-Type Header

Description: Write a Python program using the socket module that parses a specific header value from a raw HTTP response and makes a GET request to retrieve the Content-Type header.

Your task is to implement the following functions:

1. `get_header_value(response: str, header_name: str) -> str`: This function extracts the value of a specific header from a raw HTTP response string. Return empty string if not found.
2. `request_content_type() -> str`: This function creates a socket, connects to 'httpbin.org' on port 80, sends a GET request to '/json', receives the response, and returns the Content-Type header value.

Input: None.

Output (without unit test): The Content-Type header value.

Output (with unit test):

```
Testing get_header_value ...
test attribute passed: application/json is equal to application/json
test attribute passed: 10 is equal to 10
test attribute passed: is equal to
Testing request_content_type ...
connect called with: call(('httpbin.org', 80))
send called with: call(b'GET /json HTTP/1.1\r\nHost: httpbin.org\r\nConnection:
close\r\n\r\n')
recv called with: call(4096)
test attribute passed: application/json is equal to application/json
```
