

HTTP Server 404

Description: Write a Python program using the socket module that creates an HTTP server returning 200 for '/index.html' and 404 for all other paths.

Your task is to implement the following functions:

1. `create_server()` -> `socket.socket`: This function creates a TCP socket, sets `SOCK_REUSEADDR`, binds to ('localhost', 8080), listens with backlog 5, and returns the socket.

2. `get_response(path: str)` -> `bytes`: This function returns an HTTP 200 response with 'Hello World' content for path '/index.html', and a 404 response with '404 Not Found' content for any other path.

3. `serve()` -> `None`: This function runs the server using `select`, parses the request path, calls `get_response`, sends the response, and handles `KeyboardInterrupt`.

Input: None.

Output (without unit test): The server runs and handles requests.

Output (with unit test):

```
Testing create_server ...
bind called with: call(('localhost', 8080))
listen called with: call(5)
Testing get_response ...
test attribute passed: b'200 OK' is in b'HTTP/1.1 200 OK\r\nContent-Type: text/html\r\nContent-Length: 37\r\n\r\n<html><body>Hello World</body></html>'
test attribute passed: b'404 Not Found' is in b'HTTP/1.1 404 Not Found\r\nContent-Type: text/html\r\nContent-Length: 39\r\n\r\n<html><body>404 Not Found</body></html>'
Testing serve ...
accept called with: call()
test attribute passed: call(('localhost', 8080)) is equal to call(('localhost', 8080))
test attribute listen passed: True is True
test attribute accept passed: True is True
test attribute close passed: True is True
```
