

HTTP Server Routes

Description: Write a Python program using the socket module that creates an HTTP server with multiple routes: '/', '/about', and '/contact'.

Your task is to implement the following functions:

1. `create_server()` -> `socket.socket`: This function creates a TCP socket, sets `SO_REUSEADDR`, binds to ('localhost', 8080), listens with backlog 5, and returns the socket.
2. `get_route_response(path: str)` -> `bytes`: This function returns different HTML responses based on path: '/' returns 'Welcome Home', '/about' returns 'About Us', '/contact' returns 'Contact Us', and all others return a 404 response.
3. `serve()` -> `None`: This function runs the server using `select`, parses the request path, calls `get_route_response`, sends the response, and handles `KeyboardInterrupt`.

Input: None.

Output (without unit test): The server handles different routes.

Output (with unit test):

```
Testing create_server ...
bind called with: call(('localhost', 8080))
listen called with: call(5)
Testing get_route_response ...
test attribute passed: b'Welcome Home' is in b'HTTP/1.1 200 OK\r\nContent-Type: text/html\r\nContent-Length: 38\r\n\r\n<html><body>Welcome Home</body></html>'
test attribute passed: b'About Us' is in b'HTTP/1.1 200 OK\r\nContent-Type: text/html\r\nContent-Length: 34\r\n\r\n<html><body>About Us</body></html>'
test attribute passed: b'Contact Us' is in b'HTTP/1.1 200 OK\r\nContent-Type: text/html\r\nContent-Length: 36\r\n\r\n<html><body>Contact Us</body></html>'
test attribute passed: b'404' is in b'HTTP/1.1 404 Not Found\r\nContent-Type: text/html\r\nContent-Length: 39\r\n\r\n<html><body>404 Not Found</body></html>'
Testing serve ...
accept called with: call()
test attribute listen passed: True is True
test attribute accept passed: True is True
test attribute close passed: True is True
```
