

HTTP User-Agent Header

Description: Write a Python program using the socket module that sends a GET request with a custom User-Agent header.

Your task is to implement the following function:

1. `get_with_user_agent()` -> str: This function creates a socket, connects to 'httpbin.org' on port 80, sends a GET request to '/user-agent' with the header User-Agent: MyCustomAgent/1.0, receives the response, and returns the response body.

Input: None.

Output (without unit test): The response body containing the user agent.

Output (with unit test):

```
Testing get_with_user_agent ...
connect called with: call(('httpbin.org', 80))
send called with: call(b'GET /user-agent HTTP/1.1\r\nHost: httpbin.org\r\nUser-Agent: MyCustomAgent/1.0\r\nConnection: close\r\n\r\n')
recv called with: call(4096)
test attribute passed: MyCustomAgent/1.0 is equal to MyCustomAgent/1.0
```
