

CSV Serialization Client

Background

You will implement a TCP client that serializes a list of records into CSV and sends them to a server.

Problem Description

Implement:

- `serialize_csv(rows, header)` that returns a string containing `header` and `rows` formatted in CSV (using `csv.writer` writing to a `StringIO`).
- `main()` that connects to `localhost:6000`, serializes the records `[[['Alice', '30'], ['Bob', '25']]` with header `['name', 'age']`, and sends the resulting CSV encoded as UTF-8.

Output (with unit test)

Sent CSV (len=28)

test attribute passed: name,age is equal to name,age
test attribute passed: Alice,30 is equal to Alice,30
test attribute passed: Bob,25 is equal to Bob,25
