

CSV Serialization Server

Background

You will implement a TCP server that accepts a single connection, receives CSV data, parses it, and prints each row.

Problem Description

Implement:

- `parse_csv(text)` that takes a CSV string and returns a list of lists using `csv.reader`.
- `handle_once(server_socket)` that accepts one connection, reads up to 4096 bytes, parses the CSV, prints each row as `row: name,age`, and returns the list of rows.
- `main()` that binds to `('localhost', 6001)`, listens, and calls `handle_once`.

Output (with unit test)

```
row: name,age
row: Alice,30
row: Bob,25
test attribute passed: 3 is equal to 3
```
