

FTP File Rename with ftplib

Problem Description

You are tasked with implementing a function to rename a file on an FTP server using the `ftplib` library. The function should connect, log in, rename the file using `rename(fromname, toname)`, and close the connection.

Input Specification

The function `rename\_file(host, username, password, old\_name, new\_name)` should:

- Connect to the FTP server `host`.
- Log in with `username` and `password`.
- Call `rename(old\_name, new\_name)`.
- On success print: `Renamed '<old>' to '<new>' successfully.`
- On failure print: `Failed to rename file: <error\_message>`.
- Always call `quit()`.

Output (with unit test)

```
Failed to rename file: cannot rename
login called with call('hudan', '123')
rename called with call('/old.txt', '/new.txt')
quit called with call()
Renamed '/old.txt' to '/new.txt' successfully.
login called with call('hudan', '123')
rename called with call('/old.txt', '/new.txt')
quit called with call()
```
