

FTP File Size with ftplib

Problem Description

Implement a function that connects to an FTP server, queries the size of a remote file using `size(filename)`, prints the result, and disconnects.

Specification

```
`get_file_size(host, username, password, filename)`:  
- Connect to `host`, log in with `username` / `password`.  
- Call `size(filename)`.  
- On success: `Size of '<filename>': <bytes>` bytes.  
- On failure: `Failed to get file size: <error_message>`.  
- Always call `quit()`.
```

Output (with unit test)

```
Failed to get file size: not found  
login called with call('huda', '123')  
size called with call('/data.bin')  
quit called with call()  
Size of '/data.bin': 2048 bytes  
login called with call('huda', '123')  
size called with call('/data.bin')  
quit called with call()
```
