

UDP Echo Client

Background

In this problem, you will implement a simple UDP echo client. The client sends a text message to an echo server using UDP and prints the response it receives back.

Problem Description

Your task is to implement the following:

- A function `udp_echo(host, port, message)` that sends `message` to the UDP server at `(host, port)`, waits for a reply, and returns the decoded reply string.
- A main flow that calls the function and prints the received echo.

Specifications

- Use `socket.AF_INET` and `socket.SOCK_DGRAM`.
- Encode the outgoing message as UTF-8.
- Read up to 1024 bytes from the response and decode it as UTF-8.

Output (with unit test)

Echo received: Hello UDP

test attribute passed: Hello UDP is equal to Hello UDP
